Given a projective hyperkaehler manifold  $M$  of dimension  $2n$ , a projective manifold  $X$  and a surjective holomorphic map  $f: M \rightarrow X$  with connected fibers of positive dimension, we prove that  $X$  is biholomorphic to the projective space of dimension  $n$ . The proof is obtained by exploiting two geometric structures at general points of  $X$ : the affine structure arising from the action variables of the Lagrangian fibration  $f$  and the structure defined by the variety of minimal rational tangents on the Fano manifold  $X$ .
