**ORT:**

FU (Arnimallee 3, Raum 119)

I will report on a progress in our joint work with Bruno de Oliveira. We call a symmetric holomorphic differential  $\omega$  on a complex manifold closed if it can be written as  $\prod df_i^{n_i}$  in the local neighborhood of some point  $x_0$  of the manifold.

This property holds then for a complementary of a finite set of divisors and hence such a differential defines a holomorphic web- a set of local codimension one foliations on the manifold (possibly singular).

Note that any symmetric differential on surface defines a similar web. However the webs defined by closed differentials are very special and provide with restrictions on the topology of the ambient surface (or manifold). I will discuss some results and conjectures.
